

QUARANTINED PRODUCT MONITORING

POWER BI DASHBOARD | DATA ANALYSIS | PRODUCTION
SUPPORT

Source / Report Date: 18 December 1990

PROJECT OVERVIEW

This portfolio demonstrates the use of Power BI for monitoring quarantined products in a production-support context. The dashboard supports operational review, data analysis, and investigation workflows. All product, lot, company, and facility identifiers have been anonymized to preserve confidentiality.

Monitor quarantined product status and trends.

Support investigation with data-driven analysis.

All identifiers anonymized for confidentiality.

DASHBOARD STRUCTURE

EDITABLE MOCK LAYOUT OVERVIEW

Left Panels

PRODUCT MIX [Illustrative]
Qualitative donut or pie chart showing category composition by product grouping.

FAILURE CATEGORY [Illustrative]
Qualitative bar chart indicating relative distribution of defect or failure types. No real values reproduced.

Center Panels

RESULT COMPARISON [Illustrative]
Clustered or stacked column chart comparing affected vs. reference groups across lots or batches.

TREND MONITORING [Illustrative]
Line or area chart showing qualitative trend direction over time. Exact values not reproduced.

Right Panels

PARAMETER TREND [Illustrative]
Small multiples or line chart for parameter behavior monitoring.

STATUS SUMMARY + SOURCE DETAIL
Summary KPI panel and compact detail table listing source records. All identifiers anonymized.

MONITORING VIEWS

Category & Distribution

Category composition views display the product mix using pie or donut charts. Failure and defect distributions are visualized by category to identify higher-fallout groups. All labels are qualitative and illustrative only — no unreadable source values are reproduced.

Trend & Comparison

Product and lot comparison panels use clustered or stacked column charts to contrast affected and reference groups. Trend monitoring panels use line and area charts to track behavior over time. Visual layout closely resembles the actual Power BI report structure.

Detail & Parameter

Parameter behavior panels reveal unusual shifts or patterns across monitored variables. A detail table on the right supports drill-down to source records for investigation. All identifiers — product, lot, company, and facility — are anonymized throughout.

DATA-TO-DASHBOARD WORKFLOW

Phase 1: Data Preparation — Source Data → Cleaning & Structuring → Power BI Model

Raw quarantined product records are collected from source systems. Data is cleaned, validated, and structured into a consistent schema — removing duplicates, standardizing identifiers, and anonymizing product, lot, company, and facility references — before being loaded into the Power BI data model.

Phase 2: Reporting & Analysis — Report Visuals → Production-Support Analysis

The Power BI model drives interactive report visuals: category composition charts, trend lines, comparison panels, and detail tables. Production-support teams use these visuals to monitor quarantined material, identify unusual patterns, compare affected and reference groups, and support evidence-based escalation and disposition decisions.

ANALYSIS & PRODUCTION-SUPPORT VALUE

The Power BI dashboard delivers measurable operational value by enabling faster, repeatable, and evidence-based review of quarantined product data. Each visual panel supports a specific stage of the monitoring and investigation workflow.

Faster issue visibility & repeatable quarantine review.

Comparison of affected vs. reference groups; trend & fallout identification.

Drill down to source records; evidence-based escalation support.

DASHBOARD INTERPRETATION & LIMITATIONS

Intended Use of the Dashboard.

This dashboard supports monitoring and investigation of quarantined products. It is not intended to assert unsupported root causes or draw definitive conclusions without further validation. All visual outputs should be interpreted as operational indicators to guide review, not as final determinations.

Data Representation Limitations.

Source screenshots contain low-resolution labels and values. Exact unreadable numbers are not reproduced in this summary. No numerical values, lot IDs, or measurements have been invented. All chart representations are qualitative and illustrative only, reflecting visual structure without fabricated data.

Closing Summary

KEY TAKEAWAYS & NEXT STEPS

Continue monitoring quarantined products;
validate data quality and refresh process

Review abnormal categories and trends; document escalation and
disposition decisions

Confidentiality-preserving summary | Power BI dashboard case study
